DUNA TORRE REAL
2021 - Recovery - Rehabilitation - Reforestation

2021 - What ProDunas Marbella has wanted to do for years has become a reality: To look after and advance the health of this little dune stronghold that languishes between the sea and the Río Real Urbanisation.

When the work on the coastal path began, we carried out the Dune Conservation Project including reforestation plans. We asked for maximum collaboration from the Marbella Town Hall, begging that this tiny environment be sealed off with chain link fencing, since it had dune vegetation such as: Sea Restharrow (*Ononis ramosissima*), Wild Olive (*Olea europaea*), Tamarix shrub (*Tamarix*) and small flora such as Sea Daffodil (*Pancratium maritimum*), a plant that only blooms in midsummer and is the flagship of ProDunas.

Unfortunately, the work carried out on the coastal pedestrian path has completely destroyed this dune environment. A vast amount of work must now be done to establish new dune vegetation:

RECOVER - REHABILITATE – REFOREST

ERADICATION OF THE GIANT REED
throughout 2021

If we have the support of the Town Hall to remove reed shoots, we can schedule reforestation towards winter 2021. Any and all work must be coordinated with ProDunas Marbella to avoid further delays or the spreading of invasive vegetation.
