

SEED COLLECTION OF THE EUROPEAN MARRAM GRASS (*Ammophila arenaria*)

**EUROPEAN MARRAM
GRASS
*Ammophila arenaria***

**European Marram Grass, Beach grass
(*Ammophila arenaria*)**

This is a perennial plant. Its habitat is sandy soils and dunes.

It is a Protected Species in Andalusia.

Due to its deep root system it is used to fix dune crests. It has pointy leaves and long stems, straw-yellow in colour.

Seed collection depends on the dune environment. The seeds do not ripen uniformly but it normally happens between May and June
